Critical Appraisal of Medical Literature provides a step-by-step approach to help the reader reach a good level of proficiency in systematic critical appraisal of medical information. To this end, the book covers all the elements that are necessary to develop these skills and is a comprehensive guide to the subject. The book is written in three parts. The first part focuses on the logical justification and the validity of medical information. Its chapters present basic working definitions and discussions on relevant basic topics of statistics and epidemiology. The second part focuses on the complementary aspects of critique, common study designs and articles whose main topics are treatment, diagnosis, prognosis, aetiology, reviews, medical guidelines, audit, and qualitative research. The third part presents some statistical techniques that are commonly used in published articles. Critical Appraisal of Medical Literature is intended for those interested in developing critical appraisal skills such as psychiatric trainees preparing for the Critical Review Paper of the MRCPsych Examination in the UK, other practitioners as part of their preparation for examinations, and medical professionals and students as part of their introduction to aspects of systematic critical appraisal of medical information.

Evidence-based practice is an idea whose time has come. Few concepts can have achieved the status of unchallengeable common sense in such a short space of time, and across such a broad range of professional activity. As yet there have been few opportunities to take stock and reflect on the evidence for evidence-based practice, or the implications of its adoption. How effective or feasible is it in medicine? Is it really different? What are the consequences of not basing practice on research? Can evidence-based practice be used in non-clinical settings, where practitioners must deal with the complexity of multi-problem individuals, families and organizations? This text introduces the key concept of Evidence-Based Practice and accounts for its emergence and rapid expansion within and beyond medicine. It then goes on to describe how evidence-based practice is being translated in key areas (medicine, nursing, mental health education and social welfare) while critically appraising the strengths and weaknesses of evidence-based practice as it applies in a range of fields of professional practice.

This book presents a logical system of critical appraisal, to allow readers to evaluate studies and to carry out their own studies more effectively. This system emphasizes the central importance of cause and effect relationships. Its great strength is that it is applicable to a wide range of issues, and both to intervention trials and observational studies. This system unifies the often different approaches used in epidemiology, health services research, clinical trials, and evidence-based medicine, starting from a logical consideration of cause and effect. The author's approach to the issues of study design, selection of subjects, bias, confounding, and the place of statistical methods has been praised for its clarity and interest. Systematic reviews, meta-analysis, and the applications of this logic to evidence-based medicine, knowledge-based health care, and health practice and policy are discussed. Current and often controversial examples are used, including screening for prostate cancer, publication bias in psychiatry, public health issues in developing countries, and conflicts between observational studies and randomized trials. Statistical issues are explained clearly without complex mathematics, and the most useful methods are summarized in the appendix. The final chapters give six applications of the critical appraisal of major studies: randomized trials of medical treatment and prevention, a prospective and a retrospective cohort study, a small matched case-control study, and a large case-control study. In these chapters, sections of the original papers are reproduced and the original studies placed in context by a summary of current developments.

Aimed primarily at psychiatric trainees sitting the MRCPsych part II, this text should also appeal to more senior and junior psychiatrists, other mental health professionals and managers who need a brief but comprehensive introduction to the underlying concepts and practice of evidence-based mental health (EBMH). It covers the principal components of research methods, relevant statistics and critical appraisal processes for doctors and particularly psychiatrists. An everyday clinical relevance is maintained throughout with examples from psychiatric literature where possible.

Offers a range of sample comparative journal extracts enabling Foundation Year doctors and MRCGP and MRCPsych candidates to practise their critical appraisal skills. This title includes extracts that cover the whole spectrum of critical appraisal, together with exercises for the reader to work through independently to improve their technique.
