Excerpt from Text-Book of Fungi: Including Morphology, Physiology, Pathology, Classification, Etc The chapter on 'biologic Forms' was kindly prepared at my request by Mr. E. S. Salmon, our chief exponent of this subject, to whom I take this opportunity of repeating my best thanks. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Excerpt from A Damping-Off Fungus of Radishes During the month of June 1921, radishes of the White Icicle variety showing blackened areas were brought to the Department of Plant Pathology from a few gardens in Madison. In general appearance these radishes were very similar to those 'which Edson'a) had formerly described as being affected with an organism'which he named rheoseorangium.aphanidermatu\$1. It was 'with these radishes that the writer began to make a study of the disease to see if it was produced by the same or other organisms. This book is a printed edition of the Special Issue "Forest Pathology and Plant Health" that was published in Forests

This comprehensive and well known textbook deals with the characteristics, classification and life cycle of different species of fungi. While it provides a detailed account of bacteria, viruses, mycoplasma and lichens, it also discusses elementary plant pathology.

Coronavirus disease 2019 (COVID-19), caused by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), spread globally to pandemic proportions. Although the majority of cases have asymptomatic or mild infections, a significant proportion of cases progress to severe pneumonia and acute respiratory distress syndrome requiring critical care. Opportunistic infections following severe respiratory viral infections have been recognized since the 1918 influenza pandemic. Among critically ill patients with COVID-19, secondary fungal infections caused by Aspergillus and Candida spp. are increasingly described, affecting up to 30% of COVID-19 patients requiring intensive care treatment. This collection of manuscripts focuses on fungal infections complicating COVID-19, including immunological mechanisms and pathogenesis, diagnosis, and treatment.

Wood-destroying fungi play an important role in nature, because they are the only forms of life capable of reducing wood to its initial constituents. However, they can also be dangerous for people and property, as they can impair the stability and fracture-safety of trees. This book gives detailed information, based on new and original scientific findings, on the examination and effects of the most important species of fungi associated with failure of infected urban trees. In addition, new ways are presented for predicting the advance of decay in the living tree. The subject is illustrated and made easily accessible by numerous colored photos of fungus fruit bodies, defect symptoms, and macroscopic and microscopic pictures of wood decay. A detailed introduction to the fundamentals of wood pathology provides a way into the subjects of applied mycology and tree care for readers without previous special knowledge. Francis W.M.R. Schwarze, National Diploma of Arboriculture at Merrist Wood College, UK (1991), Master of Science in Pure, Applied Plant and Fungal Taxonomy, University of Reading, UK (1992), doctorate at Freiburg University (1995), since 1996 assistant at the Institute for Forest Botany and Tree Physiology at Freiburg University, concentrating on research into wood-destroying fungi and host-fungus interactions. Julia Engels, Diploma Forester at Freiburg University (1995), doctorate on root fungi at Freiburg University (1998). Since 1998 active in tree care and mycology in Luxembourg. Claus Mattheck, born 1947, doctorate in theoretical physics (1973), qualified as lecturer on damage studies at Karlsruhe University (1985), and now teaches there as Professor. Since 1991 he has been an officially appointed and attested expert on tree mechanics and fracture behaviour. Has been awarded numerous prizes for research and publication. Head of the Biomechanics Department at the Karlsruhe Research Centre.

In this unique supplement, we have compiled several state-of-the-art topics that are based on lectures delivered by eminent mycology experts during the 37th ICHS meeting. We hope that the esteemed audience of the Journal of Fungi will enjoy and appreciate the ever-evolving and complex field of fungal infections in vulnerable hosts.

Excerpt from A d104-Book of Mycology and Plant Pathology This book is the outcome of twenty-seven years' experience, as a teacher of botany, during which fifteen years have been given to a graduate course on the morphology, classification and physiology of the fungi, and five years to a course which combined with this consideration a parallel study of the most important cultural and inoculation methods used by the practical bacteriologist and mycologist at the present day. The English and Germans have led in the production of text-books on mycology and pathology; Berkeley, Smith, Cooke and Massee in England, Frank, Sorauer, von Tubeuf and Kuster in Germany. Americans have been behind in this important field, notwithstanding, that American plants harbor some of the most destructive fungi, which, through our careless methods of agriculture and horticulture up to the present, are annually destructive to the extent of millions of dollars. This lack is being rapidly remedied and the appearance of text-books by Duggar, Stevens, Hall and Stevens, Mel T. Cook and general monographs by Erwin T. Smith, and others, augurs well for the future of this line of literary and scientific labor. The bacteriologists have led and mycologists should follow. The following pages represent in a much extended form the lectures and laboratory exercises given by the author before his botanic classes at the University of Pennsylvania, and before public audiences elsewhere, especially, Farmers' Institutes with which he has had three years' experience as a lecturer in Pennsylvania. The arrangement of the text has been suggested by the needs of the classroom and from an acquaintance with similar work in other colleges and universities in America. It is hoped that the book and the suggestions, as to teaching which it contains, will appeal to those responsible for similar courses. The keys are given with the anticipation that they will prove useful to the student and teacher who desire exercises in the classification of the fungi: The illustrations have been chosen with care, and credit is given in all cases for those borrowed from other books and monographs. This book brings together twelve chapters on fungal pathogens with the goal of presenting an overview of the current areas of activity and the common themes that pervade research on these important organisms. The timing of the book is appropriate because we have gained sufficient insight from molecular genetic analyses to begin to make some comparisons between different fungal pathogens and to discuss the key advances that have been made. The chapters provide a broad survey of the important topics in fungal pathogenesis including morphogenesis, virulence, avirulence, and signaling. The reader also will find clear discussions of parasitism, mutualism, symbiosis, evolution, phylogeny and ecology for those fungi where these issues are especially important. Finally, many of the chapters in this book illustrate the fact that we are on the verge of a revolution in our understanding of fungal pathogens because of the application of genomics to these organisms and their hosts. The fungi included in this book represent many of the most intensively investigated fungal pathogens of plants; in this regard, a chapter is also included for pathogens in the Phytophthora group, even though these organisms are no longer classified as fungi. It is appropriate to include Phytophthora for historical reasons and, in addition, the insights in terms of pathogenesis and host-specific interactions are important to keep in mind when considering fungal pathogens. Chapters are also included on pathogens of insects and humans, as well as endophytic fungi.

Excerpt from A Handbook of the Fungus Diseases of West Indian Plants: With Six Illustrated Plates During the past year the author of the following pages has been engaged, by kind permission of the Director of the Royal Gardens, Kew, in mycological work at the Jodrell Laboratory. This work, carried out under the guidance and advice of Mr. George Massee, Chief Assistant at the Royal Herbarium and Plant Pathologist to the Board of Agriculture, has included a study of a considerable mass of material sent to Kew from various tropical colonies, and has led the author to make for his own use a general survey of the principal West Indian fungus diseases of plants, and also of other tropical fungus diseases. The following pages are published with the hope that they may prove useful as a summary to workers in tropical agricultural departments, and that there may be set before the planters in the West Indies an account of the pathological effects caused by their fungus pests and an indication of the methods of treatment which have been recommended from time to time. It has been thought fit to include along with the diseases which have been reported to occur in the West Indies the more important diseases of the same crops when they are cultivated in other parts of the world. The introduction contains some general remarks on parasitic fungi, a brief discussion of the methods of treatment most commonly in use for fungus diseases and an indication of the more important problems which are connected with the study of plant pathology in the West Indies at the present time. A diagnosis of each parasitic fungus has been given wherever it was possible to do so, and, in the more important diseases, the methods of treatment which have been actually recommended, or which would appear likely to prove effective, have been included. The more important references have been appended under each disease, and six illustrated plates have been prepared. The ground covered by the parts dealing with West Indian parasitic fungi is much the same as that contained in a paper recently contributed to the West Indian Bulletin. Published in Vol. X., No. 3, of that journal under the author's name, and entitled Fungi Causing Diseases of Cultivated Plants in the West Indies A word of explanation, therefore, appears necessary with regard to certain not inconsiderable differences between that paper and this book. Owing to the loss of time incident to transmitting the paper to England before its publication in the West Indian Bulletin, the author was not referred to in connexion with certain modifications and alterations which were made by the Imperial Mycologist to the West Indian Department of Agriculture; the paper published in the West Indian Bulletin, therefore, did not altogether express the author's views on the fungus diseases of the West Indies.
