Since IPTV uses compressed video formats such as MPEG2 and MPEG4, packet loss has a much more serious effect than it would have on uncompressed video or audio streams: the higher the compression rate, the bigger the effect every lost packet has on the picture you see.

Although Internet governance deals with the core of the digital world, governance cannot be handled with the digital-binary logic of the true or false, or good or bad. Instead, the subject demands many subtleties and shades of meaning and perception, requiring an analogue approach, covering a continuum of options and compromises. The aim of the book *An Introduction to Internet Governance*, by Dr Jovan Kurbalija, is to provide a comprehensive overview of the main issues and actors in the field through a practical framework for analysis, discussion, and resolution of significant issues. Written in a clear and accessible way, supplemented with figures and illustrations, it focuses on the technical, security, legal, economic, development, sociocultural, and human rights aspects of Internet governance. The text and approaches presented in the book have been used by DiploFoundation and many universities as a basis from training courses and capacity development programmes on Internet governance.

The TCP/IP protocol suite has become the de facto standard for computer communications in today's networked world. The ubiquitous implementation of a specific networking standard has led to an incredible dependence on the applications enabled by it. Today, we use the TCP/IP

protocols and the Internet not only for entertainment and information, but to conduct our business by performing transactions, buying and selling products, and delivering services to customers. We are continually extending the set of applications that leverage TCP/IP, thereby driving the need for further infrastructure support. It is our hope that both the novice and the expert will find useful information in this publication.

Internet TV is the quintessential digital convergence medium, linking television, telecommunications, the Internet, computer applications, games, and more. Soon, venturing beyond the convenience of viewer choice and control, Internet TV will enable and encourage new types of entertainment, education, and games that take advantage of the Internet's interactive capabilities. What Internet TV is today and can be in the future forms the context for this book. Arising from collaboration between the Columbia Institute for Tele-Information (CITI) and the European Institute for the Media (EIM), this volume investigates the advent of widely available individual broadband Internet communications and their impact on the development of Internet TV. Editors Eli Noam, Jo Groebel, and Darcy Gerbarg have collected seminal papers by leaders from the U.S. and European media and technology industries that offer a critical look at the impact of interactivity on television content, and address the need for media organizations to create interactive programming in this untapped realm with unclear consumer interest and desires. Each section of the volume fleshes out key issues and concepts of television and the Internet: \*Part I, Infrastructure Implications of Internet TV, discusses questions about the required network capacity for various quality grades to deliver individualized broadband to homes. \*Part II, Network Business Models and Strategies, addresses the business challenges of making Internet TV a financial success. \*Part III, Policy, examines policy issues, including copyright and regulation. \*Part IV, Content and Culture, reviews available content, those creating it, and how consumers view Internet TV content. \*Part V, Future Impacts, considers future global prospects for Internet TV content creation and distribution. Internet Television is an essential resource for professionals and scholars in new technology and media studies, media policy, telecommunication, broadcasting, and related areas. It is also appropriate for graduate seminars in telecommunications, media and new technologies, and broadcasting and the Internet.

This volume presents case studies of language learning beyond the classroom. The studies draw on a wide range of contexts, from North and South America to Europe and the Asia-Pacific region. Each provides principled links between theory, research and practice. While out-of-class learning will not replace the classroom, ultimately all successful learners take control of their own learning. This book shows how teachers can help learners bridge the gap between formal instruction and autonomous language learning. Although English is the primary focus of most chapters, there are studies on a range of other languages including Spanish and Japanese.

Increasingly, employees of regulatory bodies, law enforcement agencies and others who are not trained forensic accountants or experienced investigators find themselves responsible for conducting what amount to financial investigations. An engineer who oversees the cleanup of a toxic waste site might need to track down the former owners of the site to find the polluter. Perhaps the applicable licensing agency receives a complaint that an attorney mishandled a client's money. Maybe it's the attorney who needs help finding the assets with which a client's former spouse has absconded. Training in investigation techniques tends to be very limited for many employees. Training on how to find information without incurring significant expense is virtually nonexistent. This book helps fill the void. An Introduction to Internet-Based Financial Investigations will help anyone who conducts financial investigations as part of their job to

reduce their dependence on trial and error by showing them where and how to look. Using clear sections describing how to approach an investigation, including the ethical perspective; what to look for and what you find; what free and low cost internet resources are available to support investigations; and how to assemble and present the results of investigations, Kimberly Goetz guides students and beginning investigators through the complex world of financial investigations.
