This book reports on a study on physics problem solving in real classrooms

situations. Problem solving plays a pivotal role in the physics curriculum at all levels. However, physics students' performance in problem solving all too often remains limited to basic routine problems, with evidence of poor performance in solving problems that go beyond equation retrieval and substitution. Adopting an action research methodology, the study bridges the 'research-practical divide' by explicitly teaching physics problem-solving strategies through collaborative group problem-solving sessions embedded within the curriculum. Data were collected using external assessments and video

recordings of individual and collaborative group problem-solving sessions by 16-18 year-olds. The analysis revealed a positive shift in the students' problem-solving patterns, both at group and individual level. Students demonstrated a deliberate, well-planned deployment of the taught strategies. The marked positive shifts in collaborative competences, cognitive competences, metacognitive processing and increased self-efficacy are positively correlated with attainment in problem solving in physics. However, this shift proved to be due to different mechanisms triggered in the

and contemporary education to shed new light on a fascinating medieval figure whose work has an enormous amount to offer anyone with an interest in our educational processes. The book locates Grosseteste as a key figure in the intellectual history of medieval Europe and positions him as an important thinker who concerned himself with the science of education and set out to elucidate the processes and purposes of learning. This book offers an important practical contribution to the discussion of the contemporary nature and purpose of many aspects of our education processes. This book will be of interest to
