The 67 chapters of this book describe and analyse the development of Western science from 1500 to the present day. Divided into two major sections - 'The Study of the History of Science' and 'Selected Writings in the History of Science' - the volume describes the methods and problems of research in the field and then applies these techniques to a wide range of fields. Areas covered include: \* the Copernican Revolution \* Genetics \* Science and Imperialism \* the History of Anthropology \* Science and Religion \* Magic and Science. The companion is an indispensable resource for students and professionals in History, Philosophy, Sociology and the Sciences as well as the History of Science. It will also appeal to the general reader interested in an introduction to the subject.

Post-Rationalism takes the experimental journal of psychoanalysis and philosophy, Cahiers pour l'Analyse, as its main source. Established by students of Louis Althusser in 1966, the journal has rarely figured in the literature, although it contained the first published work of authors now famous in contemporary critical thought, including Alain Badiou, Jean-Claude Milner, Luce Irigaray, Andr é Green and Jacques-Alain Miller. The Cahiers served as a testing ground for the combination of diverse intellectual sources indicative of the period, including the influential reinvention of Freud and Marx undertaken by Lacan and Althusser, and the earlier post-rationalist philosophy of science pioneered by Gaston Bachelard, Georges Canguilhem and Alexandre Koyr é . This book is a wide-ranging analysis of the intellectual foundations of structuralism, re-connecting the work of young post-Lacanian and post-Althusserian theorists with their predecessors in French philosophy of science. Tom Eyers provides an important corrective to standard histories of the period, focussing on the ways in which French epistemological writing of the 1930s and 1940s - especially that of Bachelard and Canguilhem - laid the ground for the emergence of structuralism in the 1950s and 1960s, thus questioning the standard historical narrative that posits structuralism as emerging chiefly in reaction to phenomenology and existentialism.

Useful throughout history for their medical as well as other benefits, plant-derived compounds have gained particular importance recently, due to environmental factors. The isolation and characterization of plant products, the identification of their role in the plant, and ways of synthesizing identical compounds or more potent analogues are covered. Also includes

methods of culturing plant tissues and genetic engineering as a means of increasing the yield of desired substances from plants. Special emphasis is placed on plants previously unknown to Western scientists.

This completes Ed Soja's trilogy on urban studies, which began with *Postmodern Geographies* and continued with *Thirdspace*. It is the first comprehensive text in the growing field of critical urban studies to deal with the dramatically restructured megacities that have emerged world-wide over the last half of the twentieth-century.
