A detailed numerical model of opposed-flow flame spread over solid fuels is developed. The model is used

Bookmark File

PDF Tacx Flow

to study flame spread in three regimes of flame spread; the Thermal, Chemical Kinetic and Near Quiescent Regimes. Simplifying assumptions that have been historically applied to this problem are investigated and

Bookmark File

PDF Tacx Flow

their effect on the flame spread rate and flame structure are quantified in each regime. A semi-empirical flame spread formula for thermally thick fuels is developed from knowledge of the dominant simplifying assumptions in this

PDF Tacx Flow

regime. Spread rate predictions compare well to experimental and computed results. This semi-empirical model provides field variables which previous theories are unable to predict. Mechanisms of heat transfer ahead of the flame

Bookmark File

PDF Tacx Flow

are studied in each regime. Forward heat transfer though the solid fuel becomes more important in the Chemical Kinetic and Near Quiescent Regimes, a previously unknown result. The rate and path of forward heat

Bookmark File

PDF Tacx Flow

transfer is found to depend strongly on simplifying assumptions and the flame anchor location. These results explain the relationship between previous analytical and experimental forward heat transfer results. A dimensionless

PDF Tacx Flow

criterion predicting the fuel thickness at which transition from thermally thick to thermally thin is developed which compares well with experimental and computed results. Finite-rate gas-phase chemical kinetics are found to be the cause of

Bookmark File

PDF Tacx Flow

the super-thin regime of flame spread. A formula for the limiting flame spread rate in this regime is developed.

Correlation of computed spread rates with the Damkohler number is revisited.

Uncertainty in residence time due

Bookmark File

PDF Tacx Flow

to uncertainties in characteristic velocity and gas-phase properties is found to be the cause of spread in the correlation. The Damkohler number alone explains variations in many parameters although it alone cannot explain changes in gas-

Bookmark File

PDF Tacx Flow

phase activation energy. The boundary between the Near Quiescent and Thermal Regime is quantified using a dimensionless radiation number. A new extinction limit for thick fuels in the Near Quiescent Regime is discovered.

Bookmark File

PDF Tacx Flow

Radiative losses cause the flame to grow small and spread so slowly that sufficient oxygen is not available to sustain the flame. Recent experimental results confirm this conclusion.
